

# Health Matters

by  
Patsy Meridith, C.N.C.  
Owner of  
Natural Foods Market

Scientific evidence has determined that inadequate levels of serotonin, called the "feel good" brain chemical, is linked to common conditions such as weight gain, mild depression, fibromyalgia and foggy-headedness. Women more often than men are known to have associated symptoms such as mood swings, food cravings and poor quality sleep.

An amino acid, **5-HTP (5-Hydroxytryptophan)**, occurs naturally in the seed of a plant indigenous to Africa called "Griffonia simplicifolia". There's extensive scientific evidence that indicates this simple amino acid acts as a direct precursor to serotonin, which can help facilitate the regulation of mood, appetite and sleep quality.

Several double-blind studies have shown **5-HTP** to produce very good results, especially in those unresponsive to standard SSRI anti-depressant medications. **5-HTP** offers quicker, safer, more calming relief without unwanted side effects.

As always we guarantee your satisfaction.
