It's estimated that 8-9 million children are given the psychotropic drug, Ritalin, for ADHD "attention-deficit hyperactivity disorder". As an amphetamine-like stimulant, Ritalin is also an appetite suppressant, which can create nutritional deficiencies that exacerbate behavioral problems associated with poor attention and hyperactivity.

Researchers at Purdue University have found that inattentive, hyperactive children have a significantly lower blood level of DHA, a key essential fatty acid found in fish oil that studies have shown to positively influence a child's performance, mood and behavior.

A simple nutritional remedy, **Omega Swirl**, gives a child the DHA from fish oil that's needed to enhance brain function and improve behavior. With a pleasant, smoothie-like texture and taste, **Omega Swirl** has no fishy taste or smell. It's available in delicious flavors such as lemon, key lime, pineapple-coconut and mango-peach flavors that kids (and adults!) love.

As always, we guarantee your satisfaction.
