Researchers at Rutgers University have determined that by the time a man is thirty, his testosterone levels start to decline by about 10% per decade and, by age 60, he often has only half what he had at age 30. In addition to aging, other contributors to an early decline can be poor nutrition, smoking and a stressful lifestyle.

Poor testosterone production can significantly impact the quality of a man's life, which typically manifests by adversely affecting his energy, sleep, memory, mood and libido. Fortunately, the natural production of testosterone can be revitalized with a new evolutionary nutritional supplement called **Ultra T-MALE**.

The powerful unique nutrients in **Ultra T-MALE** proven to generate and regulate natural testosterone production include ViNitrox™ polyphenols, Tongkat Ali, zinc aspartate, and saponins from fenugreek. By strengthening a man's hormone-producing system, **Ultra T-MALE** can considerably improve his quality of life.

As always, we guarantee your satisfaction.
