Most women over fifty would be happy to have thicker hair, smoother skin and/or stronger nails. Production of "collagen", a structural protein that is integral in the formation of a matrix of cells in these tissues, begins to wane with age. A decline in hair volume, skin elasticity and nail strength will then become apparent.

For years, scientists have been searching for a method to help spark the regeneration of collagen production. Their research led to the discovery of "ch-OSA", a naturally-occurring compound found in **BioSil**, which activates the body's actual collagen-generating cells known as fibroblasts.

In clinical trials, **BioSil** was found to increase both hair thickness and strength by 13%, reduce fine lines and wrinkles in the skin by 30% and improve elasticity of the skin by 89%. Integrity of the nails was also noticeably improved. **BioSil** has made many women we know happy with their results.

As always, we guarantee your satisfaction.
